REHABILITATION IN VIRTUAL REALITY

# What is VAST.Rehab?

It is a software platform that combines rehabilitation and diagnostics in Virtual Reality with the ability to control multiple devices by one therapist.

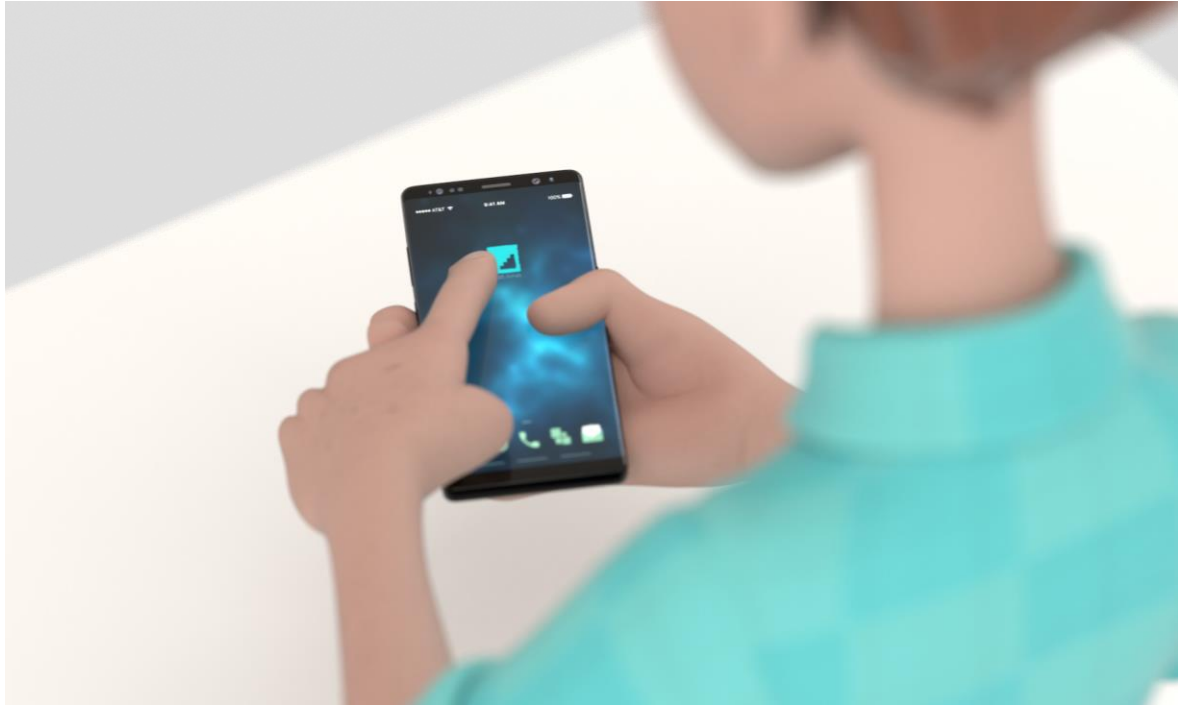

VAST.Rehab is a system using the Virtual Reality environment, dedicated to many different groups of patients.

# Therapy with **ZERO** hardware investment cost

We use a normal smartphone containing a gyroscope. The phone is used as a joystick to control the therapeutic tasks prescribed by the therapist. Users receive the onscreen instructions on how to hold it to allow tracking the prescribed movement pattern.

# Sample movements

Thera are many more of them
